

The figure is a line plot with the x-axis labeled 'Day' and the y-axis representing the number of new cases. The x-axis has major ticks for April 19, April 24, and April 29. A vertical line is drawn at approximately March 23. A red dot is located at the beginning of the data series on the left. The plot contains a large number of black lines, each representing a different state or territory. These lines start at a low value on the left, then spread out significantly after the vertical line, showing a wide range of daily new case counts across the states. The lines are most dense between the vertical line and the end of the plot, indicating a period of high variability in daily case counts across the country.
